NEW 20ft ISO TANK CONTAINER

An ISO Tank is a tank container which is built following the ISO standard (International Organisation for Standardisation), so it is suited for intermodal transport. ISO tanks are designed to transport and store liquids, both hazardous and non-hazardous. A tank container is one of the safest ways to transport fluids.

An ISO tank has a stainless steel barrel and is surrounded by various types of protective layers. Different coatings can be used, depending on the type of liquids the tank has to contain. On the top of the tank there is at least one manhole and a valve. On the bottom of the tank is another valve. The barrel is placed in a frame with standard dimensions, so the tank can be easily handled and transported worldwide per ship, train or truck. Because ISO tanks are built according ISO standards, all valves must be thoroughly inspected and each tank has three closures. All three closures must fail before the tank start leaking, so that makes an ISO tank a very safe and reliable way to contain and transport your liquid cargo
